This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etudé du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osogawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the ISCORI digestion of Drosophila DNA provided by the BDGP from the ISCORI digestion of Drosophila DNA provided by the BDGP from the BDGP's and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be Location/Quallifiers

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Direct Submitted (02-JUN-1999) Genoscope - Centre National de Sequencage : Bringle 191006 Evric cans. fr. Parker edex - FRANCE (E-mail : seqref@genoscope.cns.fr. - Web : www.genoscope.cns.fr. Parker edex - FRANCE (E-mail : seqref@genoscope.cns.fr. - Web : www.genoscope.cns.fr. - Gollaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BAGs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcokI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be found at http://www.institalo.com.du.disio.order.pub.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Buropean Drosophila Genome Project (EDGP) - http://www.edgp.cbi.ac.uk - . This Drosophila melanogaster BAC http://www.edgp.cbi.ac.uk - y his Drosophila at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

                                                    The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic transgenic plant with a male-fertile Brassica plant as useful for producing a hybrid seed by crossing the hybrid seed from the transgenic Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is primary thermal interlaced (TAIL)-PCR primer The present sequence is primary thermal interlaced to left (3') border flanking region of elite event MS-B2. This primer corresponds to position 5249-5272 of plasmid procili3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA encoding an improved barstar protein - used to restore fertility in male-sterile plant lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence was used in the preparation of an improved Bacillus amyloliquefaciens barstar, i.e. barnase inhibitor, which can be used to restore fertility to male-sterile lines.

The DNA sequence encoding the improved barstar, leads to increased barstar production in tapetum cells, due to improved translation, and possibly protein stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó

The present invention describes a pair of parent plants for producing seeds comprising: (a) a first parent plant containing at least 1 gene sequence encoding a polypeptide or protein A, and (b) a second parent blant containing at least 1 gene sequence encoding a polypeptide or protein B; where the polypeptides A and B, when expressed in separate plants, do not form an active enzyme, a regulatory protein or protein which affects the functionality and/or viability and/or the structural integrity of a cell, but when expressed in the same plant do form an active enzyme, regulatory protein, or protein which affects the structural or structural integrity of a cell. Also described is a method for producing a plant having a desired phenotype by virtue of an active enzyme, a regulatory protein or a protein which affects the structural integrity of a cell. Also described is a method for producing a regulatory protein or a protein which affects the structural integrity of a cell. Also described is a method for producing a cell according a first line with a second line where the first line contains one or more gene sequences encoding a polypeptide or the second line plants one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encoding a polypeptide or the second line contains one or more gene sequences encode line and where the contains and where the contains a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the second line contains one or more gene sequences encoding a polypeptide or protein B which is complementary to the polypeptide or protein A but which line does not have the desired phenotype. The method can be used for producing plants having altered phenotypes, e.g. male-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The barstar gene encodes and inhibitor of barnase, which degrades RNA molecules by hybridising the bond after a quantine residue. The gene is used, in a chimaeric sequence, to restore fertility in plants transformed with the gene. The promoter cassette PTA29
sterility, embryoless seeds, altered biochemical (e.g. fatty acid) composition or herbicide resistance. The present sequence encodes barstar which is used in an example from the present invention.

The HindIII-ECORI fragment (AAT39337) of plasmid prS88 contains barstar DNA under control of a 35S promoter. The plasmid was used with prS174 (see also AAT39336) contg. barnase DNA under control of the stamen-specific promoter El to produce male sterile rice cv. Kochihibiki transgenic plants, and with plasmid pvE136 (see also AAT39338) contg. barnase DNA under control of the stamen-specific PCA55 promoter to produce male sterile maize plants. Expression of barnase (a ribonuclease) in the stamen leads to male sterility. Constitutive expression of barstar counteracts possible low level expression of barnase DNA in non-stamen tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for producing male sterile plants. The method comprises inserting a promoter fragment upstream of an RNAse gene and a second promoter, upstream of an RNAse inhibitor protein gene and inserting it into the plant genome. The method is useful for producing male sterile tobacco, lettuce and rapeseed plants, but preferably rice and maize. The present sequence is an oligonucleotide used in the method of the present invention.

Shortened forms of anthocyanin (An) regulatory genes (ARG) are easier to manipulate than the complete gene and still provide An prodn. The Cl gene (and the Cl-S gene) can be considerably shortened while still retaining, under appropriate conditions, its capability of conditioning anthocyanin prodn. In the aleurone of seeds of cereal plants such as corn. A pref. shortened Cl gene is comprised in pCoL9 (see AAT08975). The full Cl gene sequence is Arrowspap and presumed sequence = AAT08973, any also be used.

Sequence = AAT08970, may also be used.

Plasmids pTS256 (AAT08976) and pTS200 (AAT17246) were used in the construction of vectors comprising the Cl and B-peru genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             easier

the nopaline synthase gene of Agrobacterium
T-DNA"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence was used in the preparation of an improved Bacillus amyloliquefaciens barstar, i.e. barnase inhibitor, which can be used to restore fertility to male-sterile lines.
The DNA sequence encoding the improved barstar, leads to increased barstar production in tapetum cells, due to improved translation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Maintainer gene; sterile; sterility; homogenous population; hybrid; seed; fertility restorer gene; pollen lethality gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Restriction fragment of construct carrying plant maintainer gene.
                                                                                                                                                                                                                                                                                                                                 a
"promoter region of rice actin gene
contains an intron in the leader"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 4032 BP; 1072 A; 968 C; 963 G; 1029 T; 0 other;

NAME OF THE PROOF 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ECORI Thindill fragment of plasmid pr2556, comprising the chimeric gene PCA55-barstar-3'nos. It is used in the course of the invention. The specification describes a process for maintaining a male-sterile corn line, using male sterile parent plants lacking a functional gene for anthoryanin production, and a maintainer corn line comprising male fertile parent plants containing foreign DNA comprising a restorer gene and an active requiatory protein gene. By using the anthoryanin gene, the colour of the male-sterile plants will differ from that of the male fertile plants. This will enable the seeds harvested from the plants to be easily separated into those that will grow into male-fertile plants and those that will grow into male-sterile plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleotide sequence of an EcoRI-HindIII fragment of plasmid pTS256.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Process for maintaining a male-sterile corn line - using male sterile plants lacking functional regulatory gene for anthocyanin production

                                                                                                                                                                                                                                                             Gaps
pollen specific promoter capable of directing expression of the pollen lethality DNA. Plants transformed with this DNA (maintainer plants) can be used to maintain a homogenous population of male sterile plants for the production of hybrid seed. This sequence is an EcoRI-HindIII restriction fragment of the construct designated pTS218 and comprises the maintainer gene described.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a

One of the plants has an expression cassette comprising a male-sterility gene, and the other plant has an expression cassette comprising a fertility restorer gene, integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds. The present sequence represents plasmid primylls. This plasmid comprises the barstar gene, which acts as a fertility restorer gene. The plasmid is used to create transgenic plants of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic winter oilseed rape plants suited for producing hybrid seed with improved qualities, comprises a male-sterility gene and fertility restorer gene, integrated into the genome

C to manipulate than the complete gene and still provide An prodn.
C The C1 gene (and the C1-S gene) can be considerably shortened
While still retaining, under appropriate conditions, its
capability of conditioning anthocyanin prodn. In the aleurone
of seeds of cereal plants such as corn. A pref. shortened C1 gene
of seeds of cereal plants such as corn. A pref. shortened C1 gene
of seeds of cereal plants such as corn. A pref. shortened C1 gene
of seeds of cereal plants such as corn. A pref. shortened C1 gene
of sequence = AAT08973.
A truncated B-peru gene (presumed sequence - AAT08674; actual
plants and service (and prs200 (AAT17246) were used in the
construction of vectors comprising the C1 and B-peru genes
as well as male-sterility gene and a selectable marker gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the nucleotide sequence of plasmid describes a process for maintaining a male-sterile corn line, using male describes a process for maintaining a male-sterile corn line, using male production, and a maintainer corn line comprising male fertile parent plants leave corn line comprising male fertile parent requiatory protein gene. By using the anthocyanin gene, the colour of the male-sterile plants will differ from that of the male fertile easily separated into those that will grow into male-fertile plants to be those that will grow into male-fertile plants and

                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plasmid prcoll3 (AAT39339) is a T-DNA vector containing a bar gene under control of the PSSU promoter, a barnase gene under control of the stamen-specific PTA29 promoter, and a barstar (co-regulatory) gene under control of the Pnos promoter. 87% of oilseed rape plants regenerated after Agrobacterlum-mediated transformation using prcoll3 were male sterile. Barnase expression disturbed the function of stamen cells leading to male sterility. Constitutive expression of barstar counteracted any low level expression of barnase in non-stamen tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                  Prodn. of male sterile plants by transforming with a chimaeric construct - comprising a male sterility DNA e.g. barnase and a co-regulating gene, e.g. barstar, into the nuclear genome, useful for generating hybrid cultivars

The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic transgenic blant with a male-fertile Brassica plant and harvesting the transgenic blant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is chimeric T-DNA of plasmid problish sequence comprises right border repeat, left border repeat and 3' untranslated comprises right border repeat, left border repeat and 3' untranslated company systems of blalaphos resistance gene (bar) from stronger systems systems shygroscopicus, barnase gene from Bacillus amyloliquefaciens and barsatar gene from Arabhosphate carboxylase small subunit gene from Nicotiana tabacum and nopaline synthase gene from the T-DNA of prinz37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic Brassica plants, seeds, cells or tissues, characterized by harboring specific transformation events, particularly by presence of male-sterility gene, at specific location in its genome -
